

Enterprise Project & Workforce Management System

1. Project Title

Enterprise Project & Workforce Management System

2. Problem Description

Many organizations face difficulties in managing projects, assigning tasks, tracking employee performance, and monitoring project progress. Manual tracking methods often lead to delays, poor communication, and inefficient resource utilization. Managers need a centralized system to effectively manage both projects and workforce activities.

3. Proposed Solution

The Enterprise Project & Workforce Management System provides a centralized platform for project planning, task assignment, employee management, attendance tracking, progress monitoring, and report generation. The system allows managers to assign tasks, track deadlines, monitor employee productivity, and improve collaboration within teams.

4. Technology Stack

Frontend: React.js

Backend: Node.js, Express.js

Database: MongoDB

Authentication: JWT, Role-Based Access Control

Version Control: Git & GitHub

5. Expected Outcome

The system will help organizations manage projects and employees more efficiently. It will improve task tracking, enhance communication, increase productivity, reduce management overhead, and provide real-time insights through dashboards and reports.

6. Why did you choose this project?

I chose this project because project and workforce management are important challenges for modern organizations. This project allows me to apply full-stack development skills while creating a practical solution that improves organizational efficiency and teamwork.
